

Lab 4 – VibeCoding: Helicopter

LLM implementation chat record

User: I want you to make this final zip file which I have to submit. I provided the assigned GitHub repository.

Assistant: The lab requirements were checked. The repository README requires fixing movement/boundary behavior, adding obstacle collision/game over, distance scoring, and a one-hit shield. The submission also requires before/after 10-second gameplay videos and the LLM chat history.

User: Uploaded 08_helicopter.zip containing the repository.

Assistant: Inspected the uploaded source. The starter code had unbounded vertical velocity, no bottom boundary check, no collision detection, no scoring, and no shield.

Assistant: Implemented the requested features: bounded/immediate vertical movement; top and bottom boundaries; obstacle collision and game-over state; distance score with reset; one-hit shield activated by S/Space; R to restart after game over; HUD indicators.

Assistant: Performed Python syntax compilation on the updated Python files successfully. Pygame itself is not installed in the current execution environment, so a live graphical run could not be performed here.

Assistant: The genuine before/after 10-second gameplay recordings are not included because they must be recorded from the student's actual gameplay environment rather than fabricated. Add those recordings before submitting.
